

Subject: Editorial comments on Section 4
 From: Van Snyder

1 Edits

Edits refer to 02-007r3. Page and line numbers are displayed in the margin. Absent other instructions, a page and line number or line number range implies all of the indicated text is to be replaced by associated text, while a page and line number followed by + (-) indicates that associated text is to be inserted after (before) the indicated line. Remarks are noted in the margin, or appear between [and] in the text.

[Repeats verbatim material from 4.2, and it's upside-down: The attribute determines what variety of a parameter it is. All that's necessary here is the last sentence (but alone it would have a dangling antecedent:)] 45:28-46:1

The *type-param-attr-spec* explicitly specifies whether a type parameter is a kind parameter or a nonkind parameter.

[Sounds like the final subroutine calls the other final subroutines. Editor: Delete "calling" from the second line of Note 4.33.] 50:18+7

[The sentence "If the object ... undefined" has nothing to do with *when* an object is finalized, but rather what happens if it's not finalized. A more logical place for it is in 4.5.10.0. Editor: Move the sentence to [60:13+], making it a separate paragraph.] 60:20-21

[Editor: "which" ⇒ "that" at the first line of Note 4.58.] 61:0+2

2 Do we want to do this?

Was it intentional that a type alias cannot be specified in terms of another one?

If we want to allow it, replace "or" by a comma at [61:10] and insert ", or a previously defined type alias" at [61:11].
