

Subject: Test DO constructs at the end
 From: Van Snyder
 Reference: 03-258r1, section 2.1.7

1 Number

2 TBD

3 Title

4 Test DO constructs at the end.

5 Submitted By

6 J3

7 Status

8 For consideration.

9 Basic Functionality

10 Test DO constructs at the end, independently of whether they are tested at the beginning.

11 Rationale

12 One sometimes needs to test a DO construct at the end. One can do this with an IF statement and
 13 an EXIT statement, but these aren't quite as clear as statements specifically designed for this purpose.
 14 That a majority faction of the Fortran 90 committee agreed in principle that this is clearer is obvious
 15 from the existence of the DO WHILE statement to introduce a loop.

16 Estimated Impact

17 Minor.

18 Detailed Specification

19 Allow a new statement (or maybe two) that can be used in place of the END DO statement, with a
 20 *scalar-logical-expr* that controls whether the loop continues or terminates. Examples:

21 DO [*loop-control*]

22 *do-block*

23 UNTIL (*scalar-logical-expr*)

24 is equivalent to but a little clearer than

25 DO [*loop-control*]

26 *do-block*

27 IF (*scalar-logical-expr*) EXIT

28 END DO

29 Similarly,

30 DO [*loop-control*]

31 *do-block*

32 WHILE (*scalar-logical-expr*)

33 is equivalent to but a little clearer than

```
1 DO [ loop-control ]  
2     do-block  
3     IF ( .not. scalar-logical-expr ) EXIT  
4 END DO
```

5 For symmetry, allow

```
6 DO UNTIL ( scalar-logical-expr )  
7     do-block  
8 END DO
```

9 which is equivalent to but a little clearer than

```
10 DO  
11     IF ( scalar-logical-expr ) EXIT  
12     do-block  
13 END DO
```

14 The tests implied by *loop-control* and an UNTIL or WHILE statement at the end of the loop are
15 independent. That is, one can have both *loop-control* at the beginning of the loop, and an unrelated
16 UNTIL or WHILE statement at the end.
