

Subject: Generalization of generic interface blocks  
 From: Van Snyder

## 1 **Number**

2 TBD

## 3 **Title**

4 Generalization of generic interface blocks.

## 5 **Submitted By**

6 J3

## 7 **Status**

8 For consideration.

## 9 **Basic Functionality**

10 Remove the restriction that generic interfaces are prohibited to have both functions and subroutines.

## 11 **Rationale**

12 The restriction against generic interfaces having both functions and subroutines appears to serve no  
 13 purpose. Removing it could provide useful functionality, would simplify the standard, and may simplify  
 14 processors.

## 15 **Estimated Impact**

16 Trivial for the standard, small to trivial for implementations, depending on how they presently work.  
 17 For those processors that check that a *function-reference* refers to a function (C1220), or a *call-stmt*  
 18 refers to a subroutine (C1222), *after* generic resolution, the only change may be to remove a check for a  
 19 condition that's easier to handle than to prohibit. Those that put a flag in a generic interface to indicate  
 20 whether it's all functions or all subroutines will need to work the other way.

## 21 **Detailed Specification**

---

22 [Add "or shall be a generic name that resolves (12.4.4.1) to a function" after "function". This edit is 266:16  
 23 probably useful in any case.]

---

24 [Add "or shall be a generic name that resolves (12.4.4.1) to a subroutine" after "subroutine". This edit 266:19  
 25 is probably useful in any case.]

---

26 Within a scoping unit, if two procedures have the same generic identifier 408:2-3

---

27 [Replace "is" by "shall be". This edit is probably useful in any case.] 408:4

---

28 [Delete "Within ... subroutines."] 408:24-26

## 29 **History**
