

Subject: Allow *expr* to be unallocated if *variable* is allocatable in intrinsic assignment  
From: Van Snyder

## 1 **Number**

2 TBD

## 3 **Title**

4 Allow *expr* to be unallocated if *variable* is allocatable in intrinsic assignment.

## 5 **Submitted By**

6 J3

## 7 **Status**

8 For consideration.

## 9 **Basic Functionality**

10 Allow *expr* to be unallocated if *variable* is allocatable in intrinsic assignment, with the result that *variable*  
11 becomes unallocated.

## 12 **Rationale**

13 There's no reason to prohibit it. It would make ordinary intrinsic assignment more like the allocatable  
14 components case. It could be useful: `a = b` would have the same effect as the following, but would be  
15 more terse.

```
16   if ( allocated(b) ) then  
17     a = b  
18   else if ( allocated(a) ) then  
19     deallocate ( a )  
20   end if
```

## 21 **Estimated Impact**

22 Trivial for the standard, and probably in the trivial-to-small range for processors. Between 3 and 4 on  
23 the N1594 scale.

24 Minor edits are needed in the first and third paragraphs of 7.4.1.3 to say what happens in case *expr* is  
25 unallocated.

## 26 **Detailed Specification**

27 Allow *expr* to be unallocated if *variable* is allocatable in intrinsic assignment. If *expr* is unallocated,  
28 *variable* ends up unallocated.

29 One could argue that the next logical step would be to allow the result of a function with an allocatable  
30 result to be unallocated, but that would put this proposal definitely at the 4 level on the N1594 scale.

## 31 **History**
